This information is being provided free of charge and with no warranties. I simply got very frustrated with the lack of information, proper documentation and general mystery of the Countach's Wiring. This is my personal documentation, use at your own risk as there are variances between VIN's, Markets and what color spool of wire they had that week. If you found value from it, I simply ask for the opportunity to earn your business Jason Jones - Lambostuff/Bullstuff.

Original Countach Door Lock Relay Control

The original Factory Door relay is not only not available to order any longer but there are no diagrams. Kiekert made the door relay, which provides an automatic engagement whenever the door locks are engaged or disengaged. After a lot of research I found a control relay, that operates EXACTLY like the original produced by the same company that produced the door actuators. MES a Swiss company produces this control relay. I have mapped out the correct connections from the OEM harness to the new Lock Control Relay. I have noticed some variations with the plug orientation on the actuators. So if you attempt this Mod, be patient and map out the wires. I would suggest purchasing the Electric-Life basic 2 Door Central Control Kit (Two actuators and the control relay for < \$90 USD
